

Remote Alarm Notification

- Deliver Immediate Alerts
- Maintain Patient/Staff Safety
- Enhance Communications
- Increased Staff Mobility
- Standardize Messaging Format
- Improve Operational Efficiencies
- Improve Staff Productivity
- Improve Patient Satisfaction

Receive Alarm Events, Remain at Point of Care

RF Technologies Systems can be integrated with mobile communication devices such as pagers, walkie talkies, and cell phones. Placing Quick Look Display boards throughout a facility reduces costs where workstations are not needed, but you want notification of alarms. Alerts and Events from low voltage systems such as Safe Place® Infant Security, SafePlace® ED/Acute Care, and Code Alert® Wireless Call can be routed to wireless paging, nurse call, telephone, and receiving systems including Spectralink, Cisco, and Avaya, creating an environment of "anytime, anywhere" communications.

Integrated Event Notification, One Platform

A standardized messaging platform can impact a caregiver's workload by saving energy and time, and directly increasing staff freedom to be mobile. At the same time enhanced communication of "Alarms" also increases patient/resident satisfaction by the improved staff response time. RF Technologies offers a unique connectivity solution allowing for multiple, disparate systems to be displayed on a single wireless communication device.

Best in Wireless for Healthcare

Overhead pages are distracting to patients/residents and can interfere with recuperation, especially during the night. Lightweight, mobile handsets offer silent, immediate text displays of patient name, room, and call status. They also offer direct call-back to the patient/resident rooms. Staff are alerted immediately from anywhere in the facility.
