

Dashboard Reports

- Community trends: response time and care time by residents
- Staff reports: users, staff care time and staff drills

Point-of-Care Data Capture and Classification

CODE ALERT® software, in conjunction with the mobile application and your smartphone, enable caregivers to receive and resolve an event at the point of care instead of returning to a central computer station for all alarm events.

- Reduce lost time: receive care reminders, wandering event alerts, and life safety alarms on smartphones, mobile devices, PDAs, and cell phones
- Document the type of care administered directly within the app
- Improve accuracy of response time documentation
- Track caregiver performance for continuous improvement
- Capture care data to better monitor residents and predict future behavior

Documentation and Reporting Ability

The CODE ALERT Quality Dashboards Module software includes multiple types of automated reports to help you better care for residents. Generate and print reports on demand for standardization and regulation compliance.

- Tailor proactive care plans, including behavior management practices
- Rely on reports for informed decision-making
- Store data in custom-tailored formats

Use Touchscreen to Easily Select “Event” Reasons

A touchscreen monitor and the software’s large icons allow you to select the Event Cause with little to no prior computer skills. Event reasons can be custom-configured, and/or standardized across communities for improved accuracy and performance tracking.
