

SAFE PLACE® Enterprise software is reliable and integrates with Infant, Pediatric, and Elopement Management solutions on a single platform. The Quality Dashboards Module is a software expansion module which significantly expands reporting capabilities.

Achievable Standards

In conjunction with the SAFE PLACE Enterprise software, the Quality Dashboards Module provides a set of tools to analyze trends, identify patterns and understand details of call system response times, patient needs, staff and shift performance in the face of ever-changing demands on your time. Administrators, directors and managers can use Quality Dashboards to both celebrate great performance and find opportunities to improve care, based on real data and trends.

Dashboards

Alarms

Useful in quickly identifying the most frequent types of alarms being made, and viewing total number of alarms by time of day to identify any gaps in shift coverage.

Clear Time

Displays the response time data for all your facility's alarms that have been classified with an alarm reason. Useful for identifying trends in alarm response times and most frequent reasons for alarms.

Shifts

Displays a dashboard with response time data for your facility's alarms per shift. Information is displayed both numerically and visually for ease of use, and can be filtered to meet your needs.

Staff

Displays alarms and clear times by staff member, useful for identifying your top performers and identifying staff members that may need additional assistance or training.

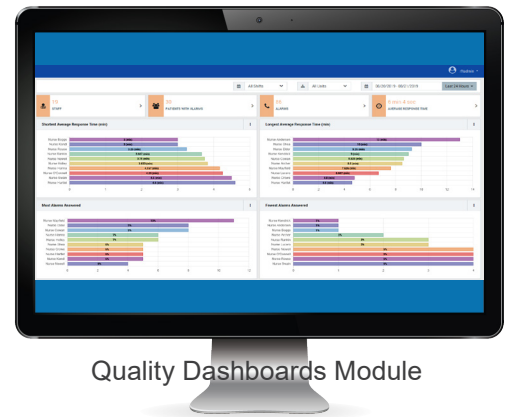

Quality Dashboards are a key piece of your quality program

Administrators and directors can use the Quality Dashboards to support quality assurance programs.

- Data can be used to analyze alarm response times during key parts of the day so you can plan staff levels and identify positive or negative trends.
- Alarms from individual patients can be analyzed by type and total clear time; identify trends that may indicate, in advance, that a patient's care needs may need revision.

Features

- No separate server required
- Runs in parallel to SAFE PLACE Enterprise software
- Quality Dashboards are continuously updated
- Remote view available from wherever you can access the server
- Six months of data available, viewed in selectable time periods
- Data can be exported to PDF or CSV

Quality Dashboards Module

How to get the most out of your Dashboard

Capture Alarm Reason

By entering alarm reasons by smartphone or at the central location, you can analyze patient patterns around specific alarm types.

Capture Staff Data

Setting each staff member with their own user account in the Enterprise software allows you to track which staff member addressed the incident. Document performance and identify superstars, training opportunities or resource adjustment needs.

Use Real Data

By identifying continuous improvement opportunities then taking action, you can see the results of your improvements in the coming days and document the positive results of your quality improvement program.
