

## Features

- Room-level locationing with resident identification
- Improves caregiver response time
- Provides greater sense of security for residents
- Indoor and outdoor coverage
- Scalable and flexible

## Locate Residents Quickly with Room-Level Location Detection

Room-level Location Detection is a feature of the Quick Response® Plus Wireless Call Solution, offering the flexibility of room-level locationing for residents in need of assistance. When a resident pushes a wireless pendant button, the resident's name, room number and location are promptly transmitted to caregivers so they can respond quickly.

- Central computer stations display alerts that show the resident's location details on a community map
- Staff can be easily notified via pagers, Quick Look™ LED displays, or wireless phones that show text messages or emails

## Flexible Resident Location Detection Options

The flexibility of our location detection feature enables you to choose a solution that best accommodates your community and workflow.

- During installation, coverage areas are "mapped" with survey points so when a pendant is activated, its location can be accurately calculated based on its comparison to mapped points.

## Customizable Solution

Additional call devices, such as stationary pull cords and call buttons, may be added when your community expands or is remodeled, resulting in a scalable and flexible investment in your system for years to come.
