Enterprise Software Solution
CODE ALERT®
Senior Living Solutions

Features

- Connect from anywhere
- Works with mobile devices
- User-friendly
- Streamlined user interfaces
- Fully virtualizable
- Coordinated caregivers
- Quality Dashboards Module analytics tool (separate licensed component)

The **CODE ALERT® Enterprise** is an entirely redesigned and modern software platform to serve your Senior Living operational needs. The CODE ALERT Enterprise software includes the most popular Senior Living features:

- **QUICK RESPONSE® Plus Nurse Call** bedside call lights, pull cords, check-in devices, motion sensors and wireless call pendants with room-level location reporting if desired
- **CODE ALERT Wander Management** including the CODE WATCH® wander transmitter, the RFT Touchpad Exit Controller (TEC) Model T80 transmitter-based wander alarm system and TEC Model T30 perimeter monitoring.

More Care Time
Resident additions, pendant or transmitter assignments, schedule changes, and new 'off-site' status feature can all be performed from a Mobile device while your caregiver stands by the resident's side.

Easy Troubleshooting
Makes it easier to keep track of misplaced transmitters; a 'green' icon indicates an active transmitter, while 'gray' signifies a transmitter is unavailable or missing.

Soft Alarm Tones
New soft alarm and alert tones help establish a calmer, more home-like environment.

Connect From Anywhere
Caregivers can conveniently receive alerts on their mobile devices*. The ability to seamlessly view alerts, coordinate care and classify events "on the fly" improves workflow efficiency. In addition, with the browser-based interface you do not need a dedicated work station or need to install software on every machine. The interface allows access via your facility's secure web connection.

Mobile device notification is dependent on your site's Wi-Fi infrastructure for the reliable delivery of alarm notifications. If this application is the primary or most typical means of alert communication, it is critical that your site have robust Wi-Fi coverage and a well-managed Wi-Fi infrastructure.

Administration of the Wi-Fi network infrastructure, network traffic routing, firewalls, and network congestion monitoring is the sole responsibility of site IT staff or service providers.

SYSTEM COMPARISON

Hardware / Platform	Enterprise	Series 9x - 10x
Windows 2016 OS	✓	✓
** Virtual Server	✓	✓
Web Based w/TLS Encryption	✓	
** LDAP Authentication	✓	✓
